Inevitable Litepaper

In the hush of the unseen, shadows of a storm brew.
The Old Guard is asleep.
Something stirs. A deep thunder growls far away.
A tempest to shatter the complacent citadels.
It's Inevitable.

1. The Problem With Decentralized Science

In theory, Decentralized Science (DeSci) is a movement that applies blockchain and Web3 technologies to revolutionize how scientific research is conducted, funded, shared, and validated. It aims to make science more transparent, accessible, and collaborative, breaking down traditional barriers like centralized institutions or paywalled journals. DeSci enables crowdfunding for research through decentralized platforms. Teams can raise funds globally using mainly governance tokens, bypassing traditional grant systems. Such fundraisers are typically much faster and easier than alternatives.

DeSci's "secret sauce" was supposed to be the innovation of using NFTs (non-fungible tokens) to tokenize research IP, proving ownership and enabling licensing or collaboration in a trustless manner. The first proposed tool for this, IP-NFT, was popularized by Molecule and implemented through BioDAOs, and implied that tokenholders may own a fraction of the IP through simple token ownership. *This ownership promise never materialized due to compliance reasons, and this is unlikely to change anytime soon.*

The failed promise of IP-NFTs is not the only thing that plagues DeSci. Scams and hacks, such as ones that hit pump.science at its launch, the failed multibillion-dollar listing of Bio Protocol on Binance, rugs on Pump.fun, and the myriad of fake clone tokens, all hardly increase trust in the ecosystem. The hard push into memes (i.e., tokens without any inherent purpose and value other than gambling) by incumbents has caused every DeSci token generation event (TGE; i.e., token launch) to fail since the launch of pump.science. DeSci has seen a steady decline in community, trust, and value since January 2025.

There is still only a single major launchpad in the ecosystem, and that's Bio Protocol's. The lack of competition discourages innovation and quality improvement due to a lack of choice. Many new DAOs fail to pursue scientific rigor, and many teams lack the skills to determine which research is valuable. The majority of DeSci DAOs emphasize social media activity to keep the community interested in the token, often overblowing the potential impact of funded projects, essentially turning into modern snake-oil salesmen. Once the promises from these announcements do not materialize, whether the grift is on purpose or by chance, the community loses even more trust in the ecosystem.

Currently, DeSci DAOs lack a plan that links success to an impact on the token. There is no standard plan to grow the treasury so that more research could be funded, other than a vague promise, resulting in a short DAO lifespan. When thinking about increasing value, teams often think of the governance token being the product: this distorts incentives. All of this turns away early supporters, as well as long-term token holders.

In reality, DeSci has evolved from a concept launched only a few years ago, with immense potential to greatly improve how science is funded and published, to a low-impact crypto play of governance tokens and memes today.

These trends are disheartening.

The original purpose of DeSci has been lost.

It is time we recover it.

2. The Solution: Inevitable Protocol

The Inevitable Protocol is the response to the frustration we felt evolving as builders in DeSci since early 2022. The authors of this whitepaper have collectively launched five DAOs, co-founded 36 companies, and achieved 10 successful exits, securing capital in excess of $300 million, with an additional $10 million raised for DeSci initiatives.

Inevitable is a protocol consisting of:

- The Inevitable Ecosystem
- Inevitable Launchpad
- Inevitable Accelerator
- Inevitable Incubator

2.1 The Inevitable Ecosystem

2.1.1 Operational Principles

Inevitable's purpose is to usher in a new Gold Standard in DeSci. Teams and DAOs using the Inevitable Protocol shall abide by the following principles:

1. A DeSci DAO's mission is to accelerate exponential technologies for the benefit of mankind. Such DAOs fund and implement *heavily vetted* frontier research *to deliver it to the user or patient in the shortest time possible*. DAOs may employ revenue-generating mechanisms by selling IP, products, processes, machines, designs, or advice that *demonstrably* improve or enhance the human condition.

2. Founding teams may not be anonymous and shall be heavily vetted before admittance to Inevitable to determine that they possess the skills, commitment, and competencies necessary to build and run a successful DeSci organization. Regardless of the team members' backgrounds, possessing a strong entrepreneurial spirit is of utmost importance. Teams shall use Scientific Advisory Boards and clear criteria to review projects to fund and implement, and shall not depend purely on a community vote for it. *Scientific rigor is paramount*.

3. We do not fund science for the sake of science. We do not fund basic research that could otherwise be funded from other sources, unless the opportunity cost is clear and clinical relevance is imminent.

4. Inevitable DAOs may issue governance tokens, clearly stating which rights the tokenholders have. We do not misrepresent these rights to tokenholders. Tokenomics are published and clear pre-launch. *Organizations and mechanisms within the Inevitable Ecosystem shall not issue memecoins.*

5. Inevitable DAOs use the Inevitable Launchpad, which is designed for uncomplicated and transparent presales, with predictable performance. TGEs are significantly defended from value drops, MEVs, and meme traders with a myriad of established DeFi mechanisms, as well as through the Inevitable Ecosystem mechanics.

6. DAO tokens are only released through a time-delay mechanism. Rugs are made impossible through hard-coded and transparent Ecosystem mechanisms. Team tokens are vested over a minimum of 4 years, with a one-year cliff. DAO Core Teams are obligated to stop vesting for non-performing or uninvolved team members.

7. Inevitable DAOs shall launch with a published Roadmap. The Roadmap shall define the activities, milestones, and deliverables of the DAO for the first 18 months. Roadmaps may be changed by

community vote only. Should the team not be able to deliver on the Roadmap, enforcement tools may be used, such as extending the vesting cliff, prohibiting enjoyment of incentives, etc.

8. DAOs are incorporated and demonstrably compliant in multiple geographies. No organizational compliance risk shall be borne by tokenholders.

2.1.2 Types of DAOs that are uplifted through Inevitable

Inevitable shall support the following types of DAOs:

1. Frontier DAOs
Frontier DAOs fund and implement high-impact frontier research that otherwise may be underfunded or neglected. In order to qualify for Inevitable, the solutions, therapies, or products resulting from this research must be of the highest benefit to humankind. These DAOs steer research revenues into the Inevitable Ecosystem, involve the community as reviewers and evaluators, and employ a variety of means to increase the perceived impact and value of the research by the public.

Moonshots and “springboard” projects that aim to jumpstart entire industries are preferred. Heavily underfunded and otherwise neglected research fields and approaches aimed at producing solutions for high-impact “missing links” are favored over others. Research topics are not limited to medicine, and teams are encouraged to explore other avenues within exponential technologies. Examples of broad themes may include nanotechnology, cybernetics, biological replacement, human biostasis and cryosleep for space travel, space biology, uncommon approaches to longevity, and human enhancement.

2. Forge DAOs
A Forge DAO is a “revenue-first DeSci DAO” that organizes research and product development primarily to create cash-flowing, near-term commercial assets, often consumer- or patient-facing products or services, rather than funding decades-long basic-science projects. They bridge the gap between web3 incentives and traditional DeSci biotech funding. By delivering tangible products within months instead of years, a Forge DAO keeps the community engaged, sustains its treasury, and demonstrates a new playbook for science funding that can later scale into deeper, longer-horizon research once a stable cash engine is secured. The role of the community in Forge DAOs is to act as focus groups, testers, and early buyers.

For example, a Forge DAO may launch a line of community-formulated peptide-based compounds for fast wound repair, run an NFT-gated marketplace, return profits into the treasury, and improve the products through continuous A/B testing. For contrast, a DAO that takes minority equity stakes in specialized small-molecule biotechs that may exit only after lengthy clinical trials would not qualify as a Forge DAO.

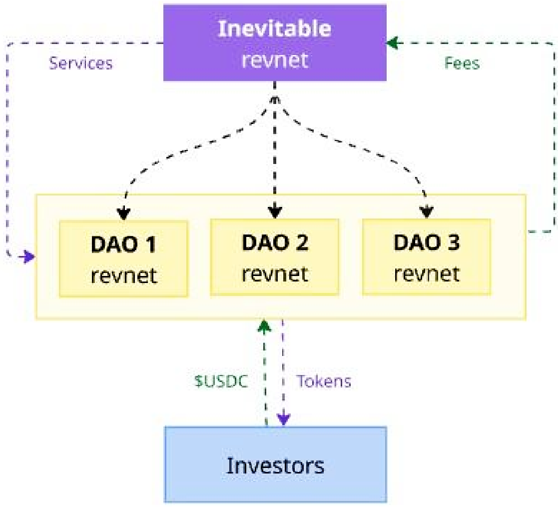
Together, Frontier and Forge DAOs form Inevitable’s two-engine model: quick commercial wins today, civilization-shifting discoveries tomorrow.

2.1.3 Tokens backed by real-world revenues: revnets

The crisis of confidence in DeSci today is a product of scams, rugs, hacks, irrational market behavior, and a lack of trust in teams. While we can’t program a human to make only rational, predictable decisions we can trust, we can do so with automated token nodes.

Inevitable Protocol runs on a tokenized on-chain protocol coordinating a collection of token nodes whose core design is to automatically funnel real-world revenues back into the ecosystem, ensuring a recurring cash flow. The token nodes - revnets - autonomously operate their economic aspects without human interference: they sell tokens, earn revenues, pay for liabilities such as ecosystem fees and third-party services, and use the revenues to back the token and grow the treasury in a sustainable, circular way. The lack of human input into the economic aspects of the revnet post token launch secures the ecosystem against undesirable conduct, making its behavior predictable and transparent.

1. Inevitable Protocol is a circular lattice of mostly automated, interconnected token nodes called *revnets.* DeSci DAOs supervise limited aspects of revnets.
2. Revnets operate autonomously. They issue tokens and generate revenues in a transparent, predictable way. The revenues back the value of the token.
3. Tokenholders are incentivized to grow ecosystem revenues.
4. A percentage of an individual revnet's revenues benefits all other revnets in the ecosystem.



Picture 1. A simplified view of revnet mechanics within the Inevitable Ecosystem

The revenue-generating mechanisms of Inevitable's revnets are surprisingly straightforward:

a. Tokens are minted only at the moment of purchase, increasing the circulating supply.
b. "Selling tokens" back into the revnet burns them, decreasing the circulating supply.
c. The revnet increases the price per token at the end of defined epochs, meaning that, e.g., 1 USDC will mint fewer tokens at the end of such periods. This increases the price ceiling.
d. On every mint, the revnet sends a percentage of tokens to its "operator" - the DeSci DAO, a percentage is used to pay ecosystem fees, and the rest is sent to the purchaser.
e. As the revnet's operator, the DeSci DAO steers its own project revenues from research commercialization to buy more tokens. I.e., when a DAO sells a product or patent, licenses IP, or otherwise generates fiat revenues through its work, it is contractually bound to "buy" more tokens from the revnet at defined epochs, contributing to its treasury and increasing the price floor.

f. All money paid to mint the token is deposited into the revnet treasury. These “revenues” back the value of the token. As the revnet treasury increases, so does the price floor.
g. Tokenholders can cash out by “selling” back into the revnet. Cashing out returns a proportional share of underlying USDC, minus a cash-out fee - an additional revenue source for the ecosystem. Given that the tokens are burned at cash-out, the price floor increases.

The table below illustrates the effect of various actions on the revnet.

Action	Price floor	Price ceiling
Incoming revenues: token buys, fees	↑	-
Token burns: cash outs, planned burns	-	-
Planned issuance halvings, i.e., fewer tokens per 1 ETH	-	↑
Higher ecosystem fees	-	-
Higher redemption rate	↑	-

Most functionality of the revnet is set at its formation and is automated. Its economic activity is transparently operated smart contracts.

A DeSci DAO will, through the Inevitable Launchpad, launch a revnet. DeSci DAOs operate the non-economic aspects of the revnet. Each token held gives governance rights to the tokenholder over the aspects operated by the DAO. Thus, only the tokenholders may decide on revnet mechanisms that directly or indirectly impact token behavior.

Picture 2. A depiction of the management flow mechanics for non-automated aspects of the revnet

The mechanisms above have been designed to ensure:

- *Stakeholder alignment*: all community members, be it builders, investors, or customers, hold no privileged power, and have equal incentives to grow ecosystem revenues over time
- *Clarity and loyalty*: automated tokenomics based on clear rules rewards and favors those who take on more risk, invest early, and hold longer;
- *Trust*: the system is rug-proof; all inbound funds are held in the revnet - not in the DAO treasury - and back the token's value. They're only accessible by cashing out, eliminating potential suspicious or non-compliant behavior by teams and stakeholders;
- *Liquidity*: the revnet maintains an issuance rate (price ceiling) and a cash out rate (price floor), if an AMM exists that offers a better price, inbound fees automatically buy-back from the market instead of new issuance; and
- *Sustainability and clear role of DeSci*: the ecosystem feeds itself through automated fees and revenues, and every dollar in revenue by the DeSci DAO operator is fed into the ecosystem as well

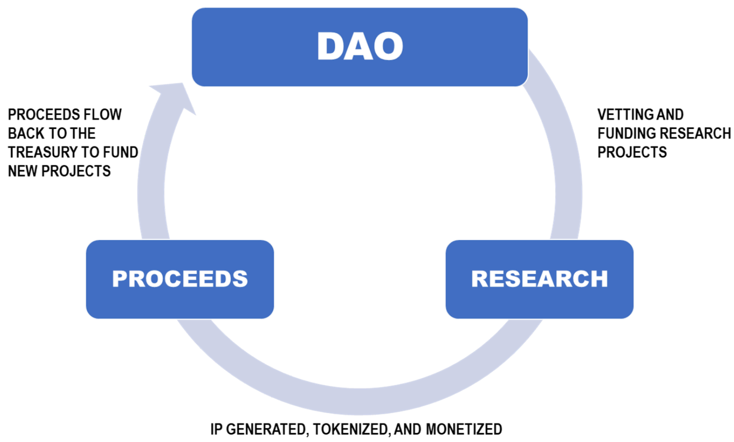
These mechanisms also get rid of a significant nuisance in DeSci so far: they leave nothing on the table for MEV bots:

- During an epoch, every mint pays exactly the same USDC-per-token price. Because the price cannot move inside a block, transaction ordering is irrelevant, i.e., front-running gives no benefit.
- The only moment the token issuance rate changes is when the pre-programmed time boundary is reached. Anyone can mint in the last minute of the cheaper window, but there is no advantage to bidding higher gas or bribing a validator; either transaction lands before the deadline or it doesn't. That is competition, not extractable value.
- Token minting and cashing out have zero slippage: since the exchange ratio is a pure formula, there is nothing to sandwich and no price impact another trader could exploit.

Finally, revnets do not pass on fees or dividends to tokenholders, and their tokens are not securities.

2.1.4 How Inevitable DAOs Create Value: The new DeSci Flywheel

IPTs were intended to be the solution for blockchain-enabled monetization of research results. In practice, the tokenization of research results has failed.



Picture 3. The old, romanticized, failed DeSci Flywheel.

Today's IPTs are simple governance tokens, offering nothing but governance rights over the DAO to tokenholders. Any potential commercialization of research does not automatically impact the DAO's treasury, nor does it reward tokenholders. Today, DeSci DAO tokens often trade below treasury market cap, indicating that the token price is unlikely to change regardless of inbound revenues.

Historically, the generation of IP through R&D is capital-intensive, with long time horizons and high failure rates. For many organizations, especially startups, relying solely on IP monetization for sustainability often results in higher upfront costs than near-term returns, making it likely to deplete the treasury before meaningful revenue can be realized.

For DAOs, relying on IP alone as a treasury growth model is a high-risk, long-tail strategy that must be supplemented by near-term, recurring revenue or capital-efficient primitives like Revnets. Otherwise, they risk exhausting their runway long before any value from their research is realized.

It is time for new, sustainable mechanisms with direct impact on value generation, and a completely new DeSci flywheel based on revnets.

The key mechanism of the Inevitable Ecosystem is that each DAO's revenues flow back into the revnets.

The following example illustrates the role of a theoretical DeSci DAO in the Inevitable Ecosystem, how it may create value, and how it ensures systemic sustainability. The scenario below is for illustration purposes only.

A team of scientists forms NanoDAO, a DeSci organization aiming to greatly accelerate the development of medical nanomachines.

They apply to become an Inevitable DAO, and the team passes the vetting process. With Inevitable's assistance, the team builds a roadmap, develops marketing assets, and identifies the first few projects they want to fund. NanoDAO is announced to the community.

The presale process begins through the Launchpad. The NanoDAO revnet is launched and tokenizes itself with $nano. During the presale, the revnet's $nano issuance rate halves every week (i.e., payers mint 50% fewer tokens per USDC every week), encouraging early buyers. Each token buy mints one token for the buyer and sends one token to the DAO treasury. All USDC paid to mint tokens remains in the revnet's treasury.

The presale concludes. The revnet uses a percentage of proceeds to set up a DEX pool. The $nano token is now liquid and tradeable with the revnet as well as on the DEX.

NanoDAO's lockup period concludes. They now need money to start funding projects. The only way for NanoDAO to generate USDC for its operations is to burn some of the $nano now in their treasury with the revnet (cash-out), which includes paying a fee. Given the revnet's revenue-generating mechanisms and the token utility, NanoDAO is heavily incentivized to burn just the minimum amounts they need every month.

Newcomers must pay progressively more USDC per token, so earlier holders enjoy built-in mark-ups. Selling forfeits this tailwind. Fewer fresh tokens enter circulation each epoch, improving the supply-demand balance for existing holders. Holders who voluntarily lock up or stake their holdings are rewarded.

Tokenholders have governance rights over the DAO as well as over particular non-economic aspects of the revnet.

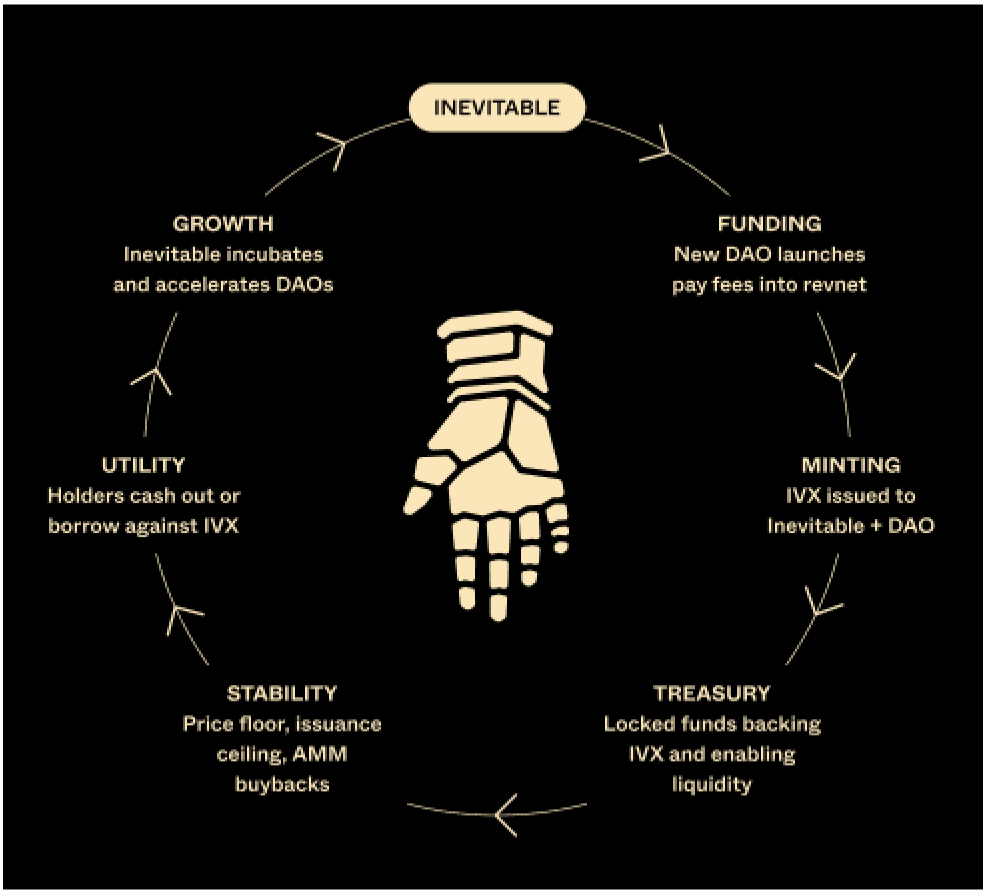
NanoDAO funds its first project, and has a breakthrough within several months. The community is excited, and ***knowing that all revenues generated by the DAO will be used to buy more $nano***, many more buyers decide to preempt this by buying more $nano themselves. Not only are the buyers motivated to acquire more $nano sooner, given the issuance rate halving at the end of epochs, but NanoDAO is greatly motivated to accelerate its revenue generation. The price ceiling and floor rise notably, and given mechanisms such as rewards for staking and lockups, as well as cash-out fees, the revnet treasury grows significantly.

In the course of its operations, the revnet pays a percentage of its revenues into the ecosystem, i.e., buys other revnet tokens, ensuring that each revnet benefits from the success and operation of every other revnet in the ecosystem.

NanoDAO's first project is a success, and a licensing deal is negotiated. NanoDAO thus generates revenues, and uses them to buy more $nano. It then cashes out enough to fund its second project.

The cycle continues.

The Inevitable Ecosystem thus creates the new DeSci Flywheel:



Picture 4. Inevitable's DeSci Flywheel.

2.2 The Launchpad

The Launchpad is Inevitable's efficiency engine.

Founding teams use this web-based app after passing a vetting process to set up, advertise, and launch their DeSci DAO. It allows DAOs to set up their revnet token presale in a simple and user-friendly way, set up any additional Ecosystem mechanisms particular to the revnet, and ultimately enable successful revnet operations, all from a single interface.

For token buyers, the Launchpad app enables new DeSci token discovery, presale buys, and releasing tokens to their wallet per the schedule set up during presale. Most importantly, it enables in-depth monitoring of the performance of DeSci tokens and DAOs through intuitive dashboards.

2.3 The Accelerator

Most teams wishing to start a DeSci DAO fall into the following two categories:

a. The team has knowledge of crypto mechanics and a passion for a scientific theme, but no formal education and experience as researchers, or
b. The team is formed by researchers/experts, but does not have experience in launching DAOs or in DeSci

The Inevitable Accelerator is designed to turn visionary founding teams into fully fledged, self-sustaining DeSci collectives. From the moment a team joins our cohort, we guide them through the critical institutional foundations - incorporation strategies, jurisdiction selection, and legal tooling to ensure they can operate compliantly across borders.

Hand-in-hand with structure comes a robust economic and governance architecture. We co-design tokenomics that balance funding needs with long-term incentive alignment, and we supply modular governance templates (treasury policies, voting frameworks, delegation mechanics) that let founders focus on science, not spreadsheets. Every template is battle-tested, forkable, and extensible, ensuring each DAO can evolve as its community grows.

To amplify these solid foundations, our creative studio provides end-to-end launch marketing: seasoned Discord/TG moderators, striking visual identity packages, explainer videos, and social-media playbooks.

Simultaneously, we open the doors to our global network of grant makers, venture funds, domain mentors, and mission-aligned communities, instantly expanding each project's reach and credibility.

Finally, acceleration continues well after TGE. We arrange liquidity bootstrapping, co-promote milestones across partner channels, and advise on ongoing community incentive schemes that reward meaningful participation rather than mere speculation. In short, we remain an active ally long past launch, ensuring every DeSci DAO we back can concentrate on what matters most: advancing open, verifiable science for the world.

2.4 The Incubator

Inevitable's DeSci Venture Studio, the Incubator builds DeSci DAOs from start to finish. Inevitable supplies the pre-revnet capital and the concept, infrastructure, as well as operating muscle. With decentralized ideation through the Inevitable community, funding, and execution under one roof, the Incubator aims to raise the success rate of its DeSci DAOs, launch them faster, and capture the outsized upside when the winners scale.

DAOs incubated by Inevitable have access to all of Inevitable's tools and services, and hands-on assistance from Inevitable's Core Team.

2.5 Dashboards

The Inevitable Protocol includes a comprehensive, real-time dashboard suite that provides visibility into every DAO launched through the ecosystem. These dashboards are mandatory, standardized, and deeply integrated, ensuring complete transparency across governance, treasury, team behavior, token dynamics, and real-world outcomes.

Key Modules:

- **Token Performance Tracking:** Monitor live price, liquidity depth, volatility, and historical trends across all Inevitable DAOs. Visualizations include performance benchmarks, sell-pressure heatmaps, and early-warning indicators for liquidity risk or market manipulation.

- **Vesting & Unlock Transparency:** All vesting schedules, including cliffs and distribution unlocks for team members, investors, and partners, are visualized and updated in real-time. This prevents stealth unlocks, builds community confidence, and enforces discipline around token issuance.

- **Treasury Monitoring:** DAO and revnet treasuries are fully transparent, with detailed breakdowns of holdings (ETH, stables, LP positions), spending patterns, revenue inflows, and operational runway. Dashboards track treasury diversification and sustainability over time.

- **Roadmap Milestone Tracking:** Each DAO is required to publish an 18-month roadmap at launch. Dashboards track progress toward milestones, showing real-time updates, deadline adherence, and community-voted roadmap changes. This ensures promises are measurable and delays are visible.

- **Governance Analytics:** Dashboards show live voting participation, delegation activity, and proposal success rates. Governance weight multipliers for long-term stakers are transparently reflected, with modules ranking the most active and trusted participants.

Inevitable goes beyond DeFi metrics. The dashboard layer also tracks **real-world scientific outcomes** across every DAO, giving token holders and the public an evidence-based view of progress and impact:

- **Funded Research Outputs:** Each funded study or experiment is listed with metadata: title, principal investigators, methodology, timelines, results (when available), and links to publications or data releases. Peer review status and IP summaries are also tracked.

- **Spinout Companies & Translational Impact:** Dashboards track projects that result in spinout companies or external licensing deals. Token holders can view which funded efforts progressed to commercialization, what entities were created, and whether the DAO holds equity, royalties, or governance rights in the spinout.

- **Sub-revnet tokens & Research-Specific Issuances:** If a DAO creates sub-revnets and tokens tied to specific projects, IP vaults, or product lines, these are listed with performance metrics, liquidity links, and governance status. This allows for nested ecosystems within the parent DAO, all traceable within Inevitable.

- **Revenue Attribution:** Any revenue, whether from product sales, licensing, subscriptions, or royalties, is tagged back to its originating research stream. Dashboards visualize revenue origin, flow into DAO treasuries, and how revenues positively impact the entire ecosystem.

- **Public Goods & Data Releases:** DAOs that publish open datasets, tools, or protocols will have those contributions indexed and tracked. The dashboard reflects both scientific and social value generated, even where no direct revenue is involved.

3. Treasury Management, Governance, and Revenue Model

One of the most distressing problems in DeSci today is sustainable treasury management. Without a clear definition of the term, many teams struggle to understand the extent of their responsibilities. In the vast majority of cases, DeSci DAOs raise a presale financing round, leaving the proceeds to sit idly until a swap to stablecoins is needed for operations. Given the volatility of crypto, this is highly risky. It also creates an enormous opportunity cost as it fails to generate additional value for the treasury.

Inevitable maintains that it is the responsibility of DeSci DAOs' Core Teams to design and disclose to tokenholders the aspects that define how their revnet's token(s) function within the ecosystem, including the issuance mechanisms, utility, and various incentives for holders. Moreover, the funds raised from token presales cannot simply remain idle; they need to be strategically deployed to grow the treasury and ensure the long-term sustainability of the DAO's revnet. This involves leveraging proven tactics similar to those used by major crypto foundations to generate returns and maintain liquidity. By actively managing the treasury, the founding teams can ensure that the organization remains financially resilient while continuing to deliver value to its community.

Inevitable Protocol may use a variety of compliant DeSci and DeFi tools to achieve these goals in addition to ecosystem fees, such as:

- Implementing a balanced portfolio approach by diversifying investments across various asset classes, including cryptocurrencies, stablecoins, and traditional financial instruments
- Generating revenue by providing liquidity to DeFi protocols, as well as Inevitable, and earning rewards
- Participating in select liquidity pools to earn trading fees and additional token rewards
- Implementing automated market maker (AMM) strategies to facilitate trading and earn fee-sharing revenue in very select cases
- In select cases, using staking tools to ensure a continuous passive revenue source
- Implementing low-risk lending and options-trading strategies through established, select partner platforms

3.1 Ecosystem mechanics

Inevitable has been designed to transform DeSci DAO treasuries from dormant token piles into self-sustaining endowments that can fund development far beyond the next market cycle.

In addition, Inevitable Protocol may deploy a variety of tools benefiting the Ecosystem, individual token holders, and DAOs launched through the Launchpad, such as:

- A percentage of each buy at every presale acquires Ecosystem tokens and/or is distributed directly to Ecosystem revnets, making sure that each new presale benefits the entire ecosystem; the more DAOs launched, the sturdier the ecosystem becomes
- Time-weighted staking & tiered benefits for token holders: staking tokens unlocks benefits, the longer and larger the amount of tokens staked, the greater the benefits/rewards
- Longer and larger stakers get guaranteed allocations and/or discounts in new revnet presales
- The longer the staking, the bigger the multiplier on voting power
- Long/larger stakers get early access to alpha, reduced fees when interacting with certain ecosystem services in the real world (e.g., clinics), and NFTs that unlock unique, non-transferable benefits and convey "Founder" status within the ecosystem
- A percentage of token transaction fees is routed into an Ecosystem Development Fund (EDF), fueled by platform activity. The EDF develops shared services beneficial to all Inevitable DAOs

This is not an exhaustive list.

It is important to note that DeSci founding teams often aren't financial treasury management wizards. Inevitable will provide hands-on assistance and education in DAO treasury management until DAO founding teams become comfortable managing their treasuries without assistance.

Inevitable ushers in a new era in DeSci, where the long-term health and sustainability of the ecosystem are paramount, rather than a short-sighted focus on individual presales and trading fees. The ecosystem will, in a compliant way, ensure value accrual to long-term token holders as well as instill sustainable treasury management operations in each Inevitable DAO.

3.2 The Native Coordination Token

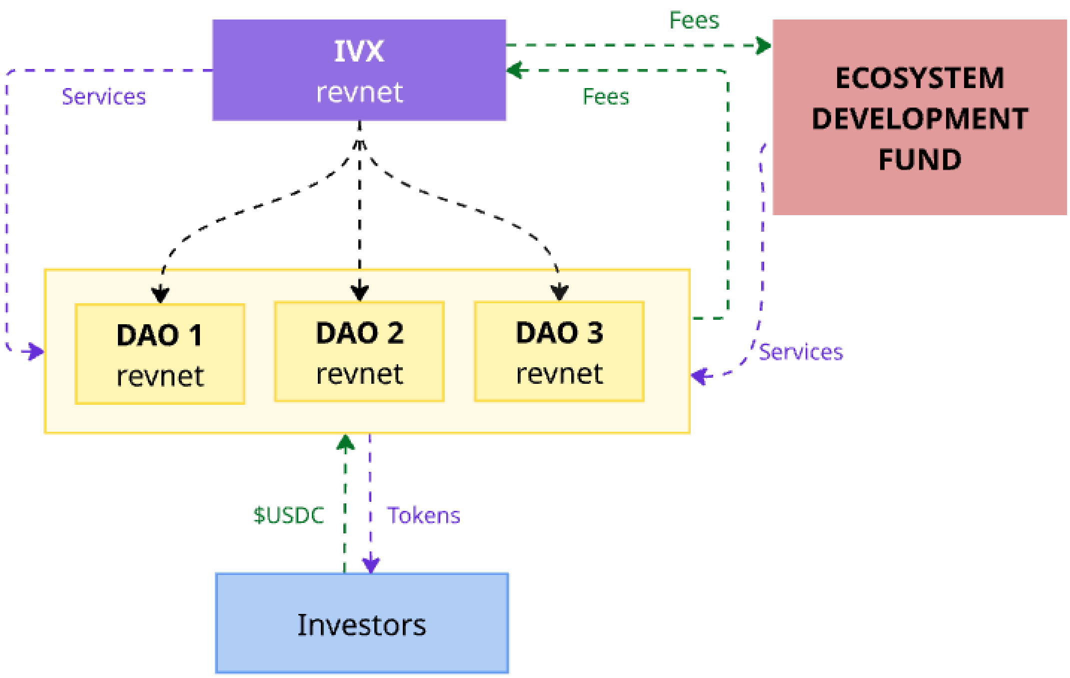
$IVX is the native revnet of the Inevitable Ecosystem, serving as both the coordination mechanism and quasi-index token of a new, reimagined DeSci ecosystem.

$IVX is:

- A governance right. Token holders influence DAO onboarding, accelerator prioritization, launchpad integrations, and community treasury mechanics.
- A utility mechanism. It unlocks access to pre-sales, protocol tools, and cross-DAO rewards.
- A long-term signal. Through compliant staking, IVX becomes a proxy for conviction, influence, and eligibility across the Inevitable ecosystem.
- A quasi-index tracking all tokens within the ecosystem.

Unlike legacy DeSci models, IVX makes no claims of legal ownership in research IP or revenue rights. It is instead a coordination asset backed by *real-world revenues*.

3.3 Revenue Model



Picture 4. The Ecosystem at a glance

The Inevitable Protocol generates sustainable, protocol-level revenue through structured value flows from every DAO launched within the ecosystem. These mechanisms ensure long-term operational capacity, ecosystem growth, and platform reinvestment. These are all subject to change.

- **A percentage of token sale Proceeds:** Inevitable receives a small percentage of the gross proceeds from each DAO token sale. These proceeds may be held, invested, used for operations, or allocated to the Ecosystem Development Fund (EDF) to support shared services and DAO tooling.
- **1% Perpetual Revenue Share to Inevitable:** All DAOs launched via Inevitable commit 1% of their gross top-line revenue, whether from product sales, licensing, royalties, or services, to support the Ecosystem in perpetuity. This is a direct revenue stream to the protocol itself and ensures ongoing alignment between DAO success and Inevitable's financial sustainability.

Each DAO launched through Inevitable becomes a Member of the Inevitable Ecosystem. The sustainability of the Ecosystem is ensured by each Member, and each Member enjoys the perpetual accrual of benefits that come from the Ecosystem feeding itself. The Ecosystem is managed and maintained by the EDF.

- **A percentage of token allocation:** The EDF captures a small percentage of the total token supply from each DAO launched through the protocol once the presale is completed. These proceeds may only be directed to fund audits, compliance tooling, launch support, and other protocol-wide ecosystem infrastructure that benefits all Inevitable DAOs. These proceeds are stored within the IVX revnet.
- A portion of fees and other revenue sources that may be added as the platform evolves is routed into the EDF through the IVX revnet.

This revenue structure ensures that Inevitable is directly incentivized to support the long-term success of each DAO it launches, and that ecosystem growth translates into protocol sustainability and growth without reliance on speculation or early token issuance manipulation.

THE END

- **Q: How do revnets algorithmically maintain both a price floor and a price ceiling for their native tokens?**
- A: Each revnet holds all incoming USDC from token mints in its on-chain treasury; this treasury sets the redeemable value when a holder "sells" back into the revnet, thereby establishing a hard price floor. The ceiling is enforced by epoch-based issuance halvings: at the close of every predefined epoch, the number of tokens minted per unit of USDC is reduced, so a constant dollar amount purchases fewer tokens over time. Because tokens redeemed are burned, exits raise the floor, while scheduled halvings lift the ceiling, ensuring a widening corridor that rewards early, long-term participants.
- **Q: The revnet model introduces a price floor and a price ceiling. How does the protocol manage the arbitrage opportunities that will inevitably arise between the revnet's mint/burn functions and secondary markets like DEXs?**
- A: The protocol is designed to leverage, rather than prevent, such arbitrage. The revnet maintains an issuance rate (price ceiling) and a cash-out rate (price floor). If an Automated

Market Maker (AMM) on a DEX offers a better price for the token than the revnet's issuance rate, inbound fees to the revnet are programmed to automatically buy back tokens from the market instead of minting new ones. This action supports the token's price on the secondary market and reduces supply, benefiting all holders. This mechanism turns arbitrage into a stabilizing force that helps maintain liquidity and align the DEX price with the revnet's internal valuation.

- **Q: Section 2.1.3 makes the explicit legal assertion that revnet tokens "are not securities." Given that their value is backed by a treasury funded by token sales and external revenues, and tokenholders can profit from the efforts of the DAO, what is the legal rationale underpinning this claim?**
- A: The litepaper asserts that revnet tokens are not securities because they do not pass on fees or dividends directly to tokenholders and should not be treated as financial investment. The primary rights conferred are governance rights over the non-economic aspects of the revnet and the DAO's operations. The value accrual is indirect, stemming from the growth of the revnet's treasury, which backs the token's cash-out value (price floor). The model is structured so that the token functions as a coordination asset and utility token within the ecosystem, rather than a direct claim on revenue or profits. However, the litepaper does this position against any frameworks and buyers will be presented by detailed disclaimers before acquisition of revnet tokens.
- **Q: The NanoDAO example (Section 2.1.4) illustrates that the DAO must cash out its own tokens to fund operations. How does the model prevent a potential "death spiral" where operational funding needs create continuous sell pressure, eroding community confidence?**
- A: The model incorporates several mechanisms to mitigate this risk. First, the DAO is incentivized to be highly capital-efficient, cashing out only the minimum required for monthly operations. Second, this cash-out action burns tokens, reducing the total supply and increasing the proportional share of the treasury for remaining holders, which can positively impact the price floor per token. Third, the core flywheel is designed to counteract this pressure: successful DAO operations lead to external revenue, which is contractually used to mint more tokens from the revnet, injecting new capital into the treasury and raising the price floor. This creates a cycle where value creation, not just operational spending, drives the token's backing.
- **Q: The Inevitable flywheel is critically dependent on DAOs using their real-world revenues to buy back their own revnet tokens. What is the enforcement mechanism for this "contractual obligation," especially for revenues generated off-chain?**

- A: The litepaper states that DAOs are "contractually bound" to channel project revenues back into their revnet counterpart. This implies a legal agreement between the DAO entity (which must be incorporated, per Principle 8) and the Inevitable protocol or a related entity. The enforcement would rely on this legal framework, with potential recourse for non-compliance. The mandatory, real-time dashboards are designed to provide transparency on revenue inflows and their subsequent use, making any deviation from this obligation visible to the community and the protocol. The document does not specify any on-chain enforcement mechanisms for off-chain revenues .
- **Q: The native token, IVX, is described as a "quasi-index" of the ecosystem. Beyond demand from staking for utility benefits, what specific value accrual mechanisms allow IVX to reflect the aggregate success of the DAOs launched on the platform?**
- A: IVX is a revnet following the same rules as the other revnets in the ecosystem. It feeds from ecosystem fees. In addition, the Ecosystem Development Fund (EDF), which is part of the IVX revnet ecosystem, captures a percentage of the total token supply from every DAO launched, functioning as a proxy for the health of all constituent DAOs. EDF provides services to the DAOs in return, making fee accrual sustainable.
- **Q: How does Inevitable receive and deploy capital?**
- A: The Inevitable Ecosystem accrues a) small percentages of every token sale, b) 1 % of gross revenues from all DAOs, c) protocol fees, and d) a percentage of revnet token allocations, which are then redistributed to mechanisms and entities operating the ecosystem. EDF funds are ring-fenced to finance audits, compliance tooling, shared services, and future protocol upgrades. All funds in general cannot be diverted to anything outside the remit defined by IVX governance.
- **Q: The protocol's revenue model includes a perpetual 1% share of a DAO's gross top-line revenue. How is this tracked and enforced, and does this create a centralized dependency on the Inevitable entity for accounting and collection?**
- A: The 1% perpetual revenue share is a foundational component of our sustainability model, contractually agreed upon by all DAOs joining the ecosystem. Enforcement relies on the combination of this legal commitment and the radical transparency provided by the mandatory dashboard suite. The dashboards are designed to track and visualize revenue attribution from its source through to the DAO treasury, with Inevitable-in-the-loop. While this requires a degree of off-chain accounting and reporting, the public and standardized nature of this data is intended to create community-enforced accountability, mitigating the need for a heavily centralized collection apparatus. The litepaper does not detail the specific auditing or reporting standards required, as these will be specified in each DAO contract.

- **Q: Section 2.1.1 states that founding teams must be "heavily vetted." What are the specific criteria for this vetting process, and which entity is responsible for conducting it?**
- A: The vetting process is a critical gatekeeping function to ensure team quality. The process determines if teams possess the necessary skills, commitment, and competencies, with a strong emphasis on possessing entrepreneurial spirit and dedication to the cause. The teams must also use Scientific Advisory Boards for project selection. The entity responsible for conducting the vetting is led by the Core Team of Inevitable, as part of the intake process for the Launchpad, Accelerator, or Incubator. The granular metrics, scoring system, and the full composition of the vetting committee may be published at a later time.
- **Q: The protocol specifies that "enforcement tools" may be used if a team fails to deliver on its 18-month roadmap. What are these tools, and what is the precise mechanism - be it governance vote or automated trigger - for their activation?**
- A: The litepaper mentions enforcement tools such as "extending the vesting cliff" or "prohibiting enjoyment of incentives" for non-performing teams. The activation of these and similar tools will eventually be tied to the roadmap tracking module on the public dashboards, which makes delays and non-adherence visible to all stakeholders. The activation of these enforcement tools is also subject to a vote or it can be triggered by another mechanism, depending on the DAO constitution.
- **Q9: The ecosystem supports both high-risk "Frontier DAOs" and near-term commercial "Forge DAOs." How does the protocol's economic model, particularly the cross-DAO revenue sharing, balance these vastly different risk and time-horizon profiles to ensure Forge DAOs don't disproportionately subsidize Frontier DAOs?**
- A: In Inevitable V1.0, a percentage of revenues and fees flows into the broader ecosystem, benefiting all revnets. This implies a uniform or pro-rata distribution. While Forge DAOs may generate revenue faster, the potential upside from a successful Frontier DAO could be orders of magnitude larger, creating a powerful tailwind for the entire ecosystem, including the Forge DAOs that provided early stability. The system is designed as a symbiotic portfolio where near-term wins from Forge DAOs sustain the ecosystem while it waits for civilization-shifting discoveries from Frontier DAOs. In the future, we may consider a risk-weighting mechanism for the distribution of ecosystem-wide benefits.
- **Q: How are rug-pulls rendered "impossible" in practice?**
- A: Key funds never sit in a mutable multisig - all presale USDC stays in the revnet treasury and can leave only when a token is redeemed. Team allocations are time-locked with a four-year vesting schedule and a one-year cliff, and vesting may be halted by DAO vote for

non-performance. Cash-out fees discourage sudden mass exits, and every redemption burns tokens, mechanically raising the floor for remaining holders. Combined, these controls remove discretionary access to large treasuries - the typical rug vector.

- **Q: How does the protocol's MEV mitigation strategy extend to interactions with external DEXs? While front-running mints within a fixed-price epoch is neutralized, couldn't MEV bots exploit arbitrage opportunities between the revnet and a DEX pool, especially around the moment an epoch changes?**
- A: Within an epoch, the mint price is constant - transaction ordering cannot influence execution price, so front-running yields no advantage. Price only changes at epoch boundaries, and inclusion is binary: either a transaction lands before the deadline or it does not, negating priority gas auctions. Mint and redemption are formulaic with zero slippage, eliminating sandwichable spread. External AMMs are only seeded post-presale. If an AMM price is more favourable, the revnet's internal logic routes buys there, further reducing exploitable arbitrage and acting as a stabilizing counter-force to MEV activities by adding buy pressure and reducing the available arbitrage liquidity. We may publish further MEV mitigation strategies for secondary market interactions in the future, such as using our own bots to then reinsert revenues into the ecosystem.
- **Q: The dashboards are designed to track "real-world scientific outcomes," including spinout companies and licensing deals. How is this off-chain data ingested, verified, and made tamper-resistant to ensure its accuracy?**
- A: The litepaper emphasizes the mandatory and standardized nature of the dashboards for ensuring transparency. The technical mechanism for ingesting and verifying this off-chain data will be implemented and maintained by the Inevitable team - a fully automated, trustless oracle system for this specific type of data is not planned. The integrity of this information will rely on a combination of self-reporting by the DAO teams, legal attestations tied to their incorporation, reporting by Inevitable, and community oversight. The public nature of the dashboards allows for community members and the Inevitable team to scrutinize the reported outcomes against public records or other external sources.
- **Q: Section 3 advocates for active treasury management using DeFi strategies like liquidity providing and lending. How does the protocol or the Accelerator program provide guidance to DAO teams on managing the significant smart contract, counterparty, and market risks associated with these activities?**
- A: The protocol explicitly acknowledges that DeSci founding teams are often not financial treasury management experts. To address this, the Inevitable team commits to providing hands-on assistance and education in DAO treasury management until the teams are

self-sufficient. This support is a key value proposition of the ecosystem. The guidance would involve leveraging proven tactics and using established, select partner platforms to implement low-risk strategies, thereby minimizing the DAOs' exposure to unaudited smart contracts or volatile assets.

- **Q: Regarding the ecosystem mechanics in Section 3.1, how is the percentage of a presale buy that benefits other ecosystem revnets determined and allocated? Is it a uniform distribution, or is it weighted by metrics like the receiving revnet's treasury size, age, or performance?**
- A: The litepaper states that a percentage of each presale buy acquires Ecosystem tokens and/or is distributed directly to Ecosystem revnets. This ensures that every new launch strengthens the entire system. The governance of the $IVX token will likely play a role in defining and modifying the specific formula or methodology for this distribution, as well as other core ecosystem parameters over time.
- **Q: How does the Inevitable protocol manage potential conflicts of interest, particularly with the Incubator, which builds DeSci DAOs internally? How do you ensure a level playing field for incubated DAOs versus those that come through the Accelerator?**
- A: The litepaper describes the Incubator as a "DeSci Venture Studio" that builds DAOs from the ground up using Inevitable's own capital and resources. The protocol's design principles of transparency and stakeholder alignment are intended to mitigate such issues. All DAOs, whether incubated or accelerated, are subject to the same ecosystem rules, revnet mechanics, and transparent dashboard reporting. This standardized framework ensures that incubated projects cannot operate with privileged information or mechanics, and their performance is judged by the same metrics as any other project on the Launchpad.
- **Q: What are the economic consequences of redemption (cash-out) for the remaining holders?**
- A1: When tokens are redeemed, the equivalent portion of USDC is withdrawn from the treasury and the redeemed tokens are burned. Burning reduces circulating supply, and removing backed tokens at par leaves the per-token share of treasury assets higher, thus mechanically raising the price floor. The cash-out fee generates additional revenue routed back to the ecosystem, providing a positive effect for holders who stay.
- **Q: Principle 8 requires DAOs to be "incorporated and demonstrably compliant in multiple geographies." Given the legal ambiguity of DAOs, how does the protocol shield tokenholders from organizational compliance risks, and what specific legal structures or jurisdictions does the Accelerator recommend?**

- A: The protocol mandates that the legal burden of compliance rests with the incorporated DAO entity, not the tokenholders. The Inevitable Accelerator provides direct support in this area, guiding teams through incorporation strategies, jurisdiction selection, and legal tooling. Inevitable has a preferred set of legal frameworks and crypto-friendly jurisdictions that are battle-tested for this purpose. By formalizing the DAO as a legal entity, the protocol aims to create a corporate veil that separates the organization's liabilities from the individuals who hold its governance tokens.
- **Q: What is the technical or legal mechanism for enforcing the cessation of vesting for a non-performing team member, as stipulated in Principle 6?**
- A16: Principle 6 obligates DAO Core Teams to stop vesting for non-performing members. The mechanism is enforced by Inevitable, as well as a clause within the legal agreements between the DAO entity and its core team members, and may require a governance vote. Given the protocol's emphasis on automation and transparency, it will be implemented on-chain directly through Inevitable's vesting interface.
- **Q: The revnet model includes a "cash-out fee." What is the primary purpose of this fee, how is its rate determined, and how are the revenues from it utilized within the ecosystem?** A17: The cash-out fee is an additional revenue source for the ecosystem. Its primary purpose is to create a slight disincentive for selling tokens back to the revnet, thereby encouraging long-term holding and reducing sell pressure. By making cashing out marginally more expensive than holding, it rewards long-term conviction. The revenues generated from this fee are returned to the revnet treasury, which in turn increases the token's price floor, benefiting all remaining holders. The fee percentage is determined for each revnet based on a set of variables.
- **Q: Principle 3 states, "We do not fund basic research... unless the opportunity cost is clear and clinical relevance is imminent." How are these subjective terms defined and who acts as the ultimate arbiter in borderline cases?**
- A: The litepaper mandates that teams use Scientific Advisory Boards and clear internal criteria to review and select projects, rather than relying purely on a community vote for scientific diligence. This board of vetted experts would be responsible for interpreting and applying these principles. The ultimate arbiter in a borderline case would be the DAO's own governance, guided by the recommendation of its Scientific Advisory Board. The Inevitable vetting process itself would also select for teams whose research focus aligns with this principle of funding translational, high-impact science.
- **Q: Regarding IP management, the litepaper critiques the failure of IP-NFTs but confirms that Inevitable DAOs can generate revenue from selling or licensing IP. What is the**

recommended legal and technical framework for this process to avoid the compliance issues that plagued earlier models?

- A: IP-NFTs promised fractional IP ownership but proved legally non-compliant and failed to translate research revenues into token value. Revnets decouple legal IP claims from token value, backing tokens with hard treasury assets and automated buy-backs from real-world revenues. Unlike IP-NFTs which attempted to grant tokenholders direct fractional ownership of IP, our revnet tokens are explicitly defined as coordination tokens with governance rights. The DAO, as an incorporated legal entity, holds and manages the IP. It can then enter into traditional off-chain licensing or sale agreements. The revenue from these deals flows to the DAO's corporate bank account and is then used to buy back revnet tokens, creating value for tokenholders indirectly by strengthening the token's backing. This avoids the direct link that created securities-like properties in the IP-NFT model.
- **Q: What is Inevitable’s comparative advantage over existing DeSci funding rails?**
- A: Unlike legacy launchpads that sell governance tokens disconnected from revenue, Inevitable’s Launchpad couples token issuance directly with revnet mechanics: mint-on-buy, automated price progression, vesting enforcement, anti-rug and MEV-resistant presales. It also surfaces mandatory dashboards, provides post-TGE liquidity bootstrapping, and standardises compliance artefacts, reducing the operational burden for scientific founders and increasing investor transparency - pain points unaddressed by even the largest biodao launchpad. The key here is that both tokenholders and DAO teams hold a token backed by real-world value.
- **Q: The litepaper mentions that sub-revnets can be created for specific projects or IP vaults. How are these sub-revnets economically linked to their parent DAO's revnet and the broader $IVX ecosystem?**
- A: The dashboard specification in Section 2.5 confirms the ability for a DAO to create sub-revnets and tokens tied to specific projects. These would be listed with their own performance metrics and governance status. A sub-revnet does not have a different economic architecture - it operates under similar mechanics to a primary revnet but is obligated to stream a portion of its revenue or fees back to the parent DAO's revnet, creating a nested flywheel. This would allow for more granular funding and tracking of specific research arms while ensuring value still accrues to the parent DAO and, by extension, the entire Inevitable ecosystem.
- **Q: Section 3.1 mentions a governance weight multiplier for long-term stakers. Is there a specific formula for this multiplier, and is it standardized across all DAOs in the ecosystem?**

- A: The litepaper confirms that longer and larger staking of tokens results in a bigger multiplier on voting power, rewarding long-term conviction with greater influence. This is a key component of the time-weighted staking and tiered benefits system. This is a standardized, protocol-wide function parameter for IVX, but the formula may change as the ecosystem matures. The governance analytics module on the dashboards will transparently reflect these multipliers for all other DAOs.

- TBD:
- **How do loans work?**
- **Where are fees incurred?**
- **How do splits work, and when are they triggered?**
- **When does revnet token issuance change, and based on which events?**
- **How does the percentage right to the treasury change, and upon which events?**
